STUDY OBJECTIVE

To compare surgical outcomes between patients undergoing prophylactic internal iliac artery ligation and those undergoing pre-op placement of balloon-occlusive devices at the time of hysterectomy for placenta accreta spectrum (PAS) disorders.
METHODOLOGY

• **Design**: Retrospective cohort study

• **Population**: All women who underwent C-hyst for PAS disorders

• **Time**: 6 years (2012-2018)

• **Location**: Tertiary care center in Ontario
